

11. Illustrate the concept of multithreading using a C program.

Program:

```
#include <stdio.h>
#include <stdlib.h>
#include <pthread.h>

// Function for the first thread
void* threadFunction1(void* arg) {
    for (int i = 0; i < 5; i++) {
        printf("Thread 1: %d\n", i);
    }
    pthread_exit(NULL);
}

// Function for the second thread
void* threadFunction2(void* arg) {
    for (int i = 0; i < 5; i++) {
        printf("Thread 2: %d\n", i);
    }
    pthread_exit(NULL);
}

int main() {
    pthread_t thread1, thread2;

    // Creating threads
    if (pthread_create(&thread1, NULL, threadFunction1, NULL) != 0)
    {
        perror("Failed to create thread 1");
        return 1;
    }

    if (pthread_create(&thread2, NULL, threadFunction2, NULL) != 0)
    {
        perror("Failed to create thread 2");
        return 1;
    }

    // Wait for threads to finish
    pthread_join(thread1, NULL);
    pthread_join(thread2, NULL);
}
```

```
    printf("Both threads have finished execution.\n");  
    return 0;  
}
```

Output:

```
Thread 1: 0  
Thread 1: 1  
Thread 2: 0  
Thread 2: 1  
Thread 2: 2  
Thread 2: 3  
Thread 2: 4  
Thread 1: 2  
Thread 1: 3  
Thread 1: 4  
Both threads have finished execution.
```
