

13. Illustrate the concept of multithreading using a C program.

Program:

```
#include <stdio.h>
#include <stdlib.h>
#include <pthread.h>

// Function executed by the first thread
void* threadFunction1(void* arg) {
    for (int i = 0; i < 5; i++) {
        printf("Thread 1: Working on task %d\n", i + 1);
    }
    pthread_exit(NULL);
}

// Function executed by the second thread
void* threadFunction2(void* arg) {
    for (int i = 0; i < 5; i++) {
        printf("Thread 2: Processing job %d\n", i + 1);
    }
    pthread_exit(NULL);
}

int main() {
    pthread_t thread1, thread2;

    // Creating thread 1
    if (pthread_create(&thread1, NULL, threadFunction1, NULL) != 0)
    {
        perror("Failed to create thread 1");
        return 1;
    }

    // Creating thread 2
    if (pthread_create(&thread2, NULL, threadFunction2, NULL) != 0)
    {
        perror("Failed to create thread 2");
        return 1;
    }

    // Wait for threads to complete
    pthread_join(thread1, NULL);
    pthread_join(thread2, NULL);
}
```

```
    printf("Both threads have completed execution.\n");  
    return 0;  
}
```

Output:

```
t Thread 2: Processing job 1  
Thread 2: Processing job 2  
Thread 2: Processing job 3  
Thread 1: Working on task 1  
Thread 1: Working on task 2  
Thread 2: Processing job 4  
Thread 2: Processing job 5  
Thread 1: Working on task 3  
Thread 1: Working on task 4  
Thread 1: Working on task 5  
Both threads have completed execution.
```
